

4 cloud migration myths busted

1.

Myth: There are higher recurring costs with cloud than on premise versions

The Truth

You could see up to 30-40% total cost of ownership savings due to cloud migration*. Why? Drivers, like workload flexibility, better server utilization rates, and increased energy-efficiency all add up to make public clouds more cost efficient than enterprise-owned data centres.

2.

Myth: Keeping data stored on premise is more secure than the cloud

The Truth

Microsoft Azure spend over \$1b each year to upgrade and secure their infrastructure, and they proactively monitor their systems with staff and technology. Very few private companies with on-premises infrastructure can rival this level of security.

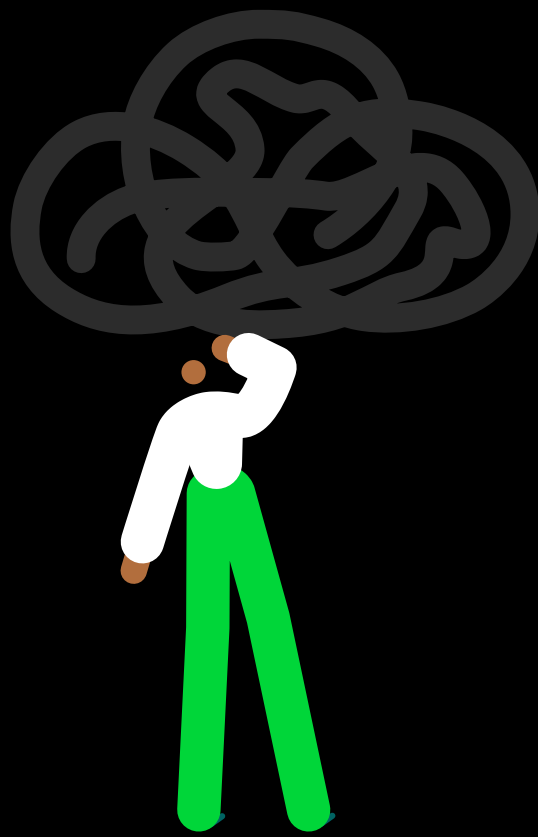

3.

Myth: Migrating to cloud will be time consuming and highly technical

The Truth

You'll find it easy with the Azure partnership. Most partners report a rapid, refreshingly simplified migration compared to other systems projects.

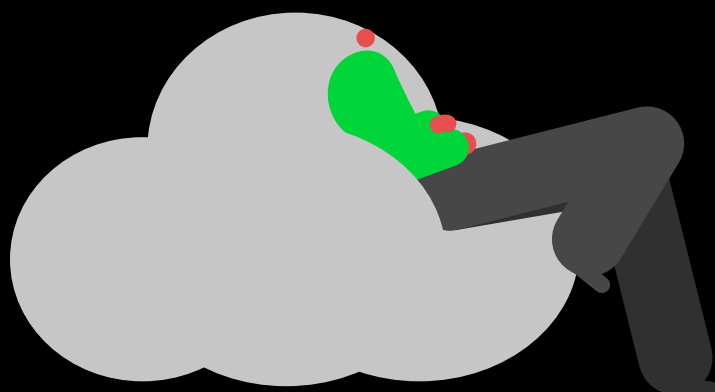

4.

Myth: Upgrading to cloud will have extensive downtime, creating productivity loss and requiring new training.

The Truth

The end user experience appears the same, requiring no additional training. Migration typically increases upload and download speeds improving employee agility and reducing lag or downtime.

Learn more about the benefits of moving to the cloud with the Sage Partner Cloud Program.
